

# Anzac Parade Flood Hazard

- To achieve a 200 year standard of flood protection requires the crest to be raised by 1.5m;
- Will require a much larger footprint than the existing structure which amongst other things will require the removal of a large number of trees;
- Estimated construction costed at \$4.05M in 2011;
- More realistic cost is around \$6M:
  - The effect of the June 2015 flood on our assessment of the height of a 200 year RP flood (ie a higher stopbank);
  - Knowledge/ understanding gained from June 2014 work;
  - Other impacts with higher stopbank eg piping risk, trafficability for SH4, vehicle ramps etc.
