# FLOOD VULNERABILITY ASSESSMENT: TAUMARUNUI

Horizons Regional Council engaged WSP and Earth Sciences NZ to lead the Horizons Flood Vulnerability Assessment, which developed a comprehensive regional flood model to evaluate the flood vulnerability of communities within the Horizons Region. This is a summary of the findings for Taumarunui, which has a population of 3,715 with 5,081 buildings. The model results show the number of buildings impacted and the estimate costs to repair those buildings in floods of different severity. For more detailed information on the flood vulnerability assessment, please refer to the Horizons Regional Council Flood Vulnerability Assessment Report (WSP 2026). The information provided in this document has been developed for a regional view of flood risk. Horizons Regional Council or Ruapehu District Council may hold more specific models and outputs that may be more reliable for decision making.

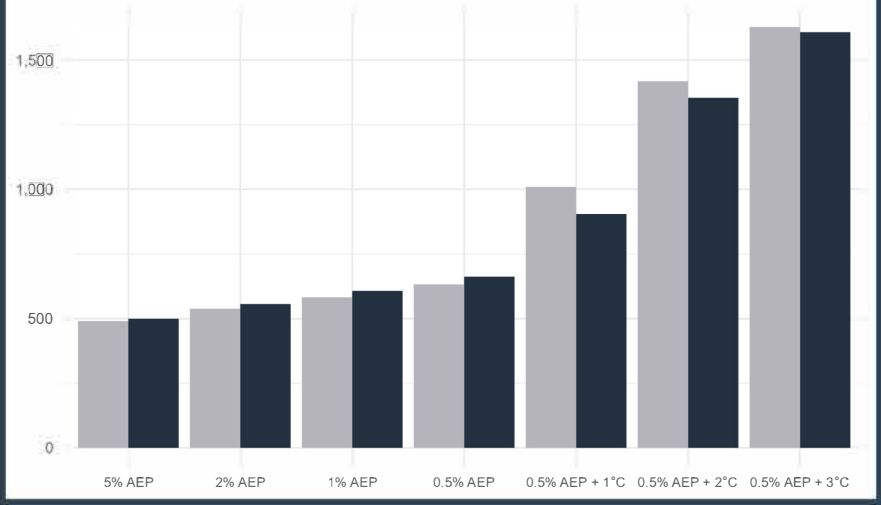

In Taumarunui, as flood events become more severe, both the extent of flooding and the depth of water increase. Annual Exceedance Probabilities (AEP) indicates the likelihood of a flood event occurring in any given year. For example, a 5% AEP means there is a 5% chance of a flood event exceeding this occurring in any given year; whilst a 0.5% AEP means there is a 0.5% chance.

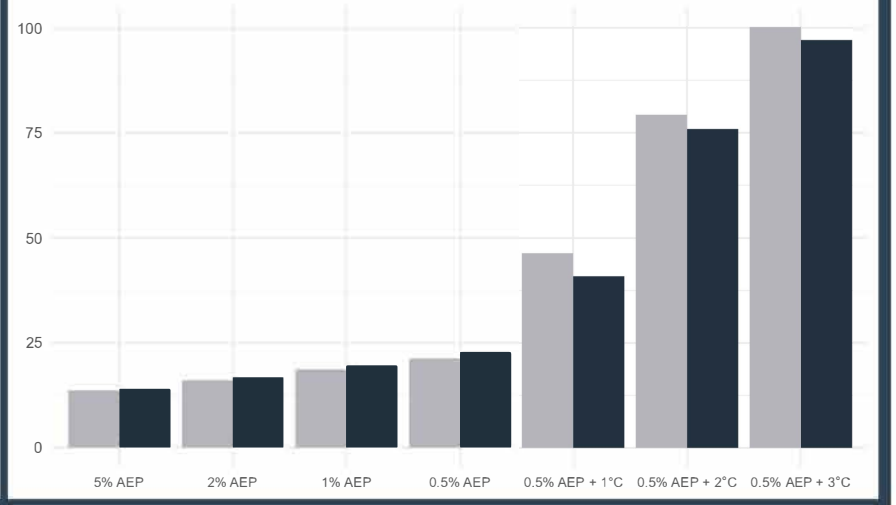

**With flood defences structures such as stopbanks in place**, approx 500 buildings could be affected in a 5% AEP flood scenario, with an estimated repair cost of around $14 Million. However, in a flood scenario of 0.5% AEP + 3°C of warming due to climate change, the estimated number of effected buildings increases to 1,608 with repair costs of around $97 Million. **Without the flood defences structures such as stopbanks in place**, the results were complex. In the smaller but more frequentflood scenarios there was a slight decrease in the number of buildings flooded and the cost to repair those buildings with the defences removed; this was likely within a margin of error. However, in the more severe but less frequent flooding, without flood defences there was an increase in both the number of buildings flooded and the cost to repair those buildings. In a flood scenario of 0.5% AEP + 3°C of warming due to climate change, the estimated number of affected buildings increases to 1,628 with repair costs of around $100 Million.

These findings highlight the importance of flood defences structures and how the presence or absence of these can influence the scale and cost of flood events across different scenarios. In a severe flood, these flood defences structures may not be enough to protect your community. This is based on regional flood modelling, stormwaternetworks and their benefits for managing surface water have not been included in this model, leading to conservative impact estimates.

Number of buildings impacted by flooding

Estimated cost to repair flood damage to buildings ($M)

Legend with flood defences structures; without flood defences structures.

The information presented on this page is a representation of the findings of the Flood Vulnerability Assessment; features shown may not be in their true extent and location. Models have a level of uncertainty, this was derived from a "Level A" Regional Scale model, which is not intended for property level use. Horizons has other flood models which may be a better fit to describe modelled flooding in your particular location; for further information, and terms and conditions of use, see: https://experience.arcgis.com/experience/3f7b4ec2f6f14503af1146ce412de39e

For more information contact us at https://www.horizons.govt.nz/contact-us

## Summary

In Taumarunui, 500 to 1,608 buildings could be impacted by flooding.

This is 10% to 32% of buildings in Taumarunui that could be impacted by flooding.

Out of the 52 settlements in the Horizons Region, Taumarunui ranks 12th for the number of buildings affected, and 28th for the percentage of buildings within a town settlement affected.
